Network Management Research Classification

The network and service management taxonomy serves as a classification system for research on the management of computer networks and the services provided by computer networks. The taxonomy has been created and is being maintained by a joint effort of and the Committee of Network Operations and Management of the Communications Society of the Institute of Electrical and Electronics Engineers and the Working Group 6.6 of the International Federation of Information Processing. The taxonomy is orga

Social network classification approaches are most useful for grouping incoming instances based on some patterns and constraints [17–21]. It can be used to predict categorical class labels and classifies data based on training set and class labels and it can be used for classifying newly available data.

One way to categorize the different types of computer network designs is by the scope or scale of the network. For historical reasons, the networking industry refers to nearly every type of design as some type of area network. Network types differ from network topologies (such as bus, ring, and star). Types of Area Networks

LANs, WANs, and Other Area Networks Explained

Logical topology refers that how a data transfers in a network as opposed to its design. The network topology can be categorized into bus, ring, star, tree and mesh. Hybrid networks (They are the complex networks, which can be built of two or more topologies together).

Health care organizations are leveraging machine-learning techniques, such as artificial neural networks (ANN), to improve delivery of care at a reduced cost. Applications of ANN to diagnosis are well-known; however, ANN are increasingly used to inform health care management decisions. We provide a seminal review of the applications of ANN to health care organizational decision-making.
