During neurite outgrowth, the actin and microtubule cytoskeletal networks work in a coordinated fashion to generate and stabilize the growing neurites [1, 8]. The actin cytoskeleton reorganizes to allow formation of the growth cone, and the microtubules re-align into bundles to stabilize the growing neurite.

The retina, which contains 150 million light-sensitive rod and cone cells, is actually an outgrowth of the brain. In the brain itself, neurons devoted to visual processing number in the hundreds of millions and take up about 30 percent of the cortex, as compared with 8 percent for touch and just 3 percent for hearing.

The smaller brain defect is not caused by defective neurogenesis, altered neuronal migration or significant neuronal cell death. Surprisingly, a dramatic increase in neuronal packing density within the postnatal brain is observed. Loss of miRNA function causes shorter neurite outgrowth and smaller soma size of mature neurons in vitro. Our results reveal the impact of miRNAs on normal development of neuronal morphology and brain function.

Through single-cell sequencing — not powerful enough even a few years ago for this type of work — and an imaging technique, the researchers discovered that a myeloid cell type called microglia promoted the outgrowth of breast cancer that has spread to the brain by the expression of several proteins.

Our data indicate that Her-2 overexpression increases the outgrowth of metastatic tumor cells in the brain in this model system. [Cancer Res 2007;67(9):4190–8] Retrospective studies of breast cancer patients suggest that primary tumor Her-2 overexpression or trastuzumab therapy is associated with a devastating complication: the development of central nervous system (brain) metastases.

The VISUAL CORTEX “It may be a mistake, however, to think of the eye as an outgrowth of the brain as is popularly suggested. It would be more accurate to think of the brain, or at least part of it, as an evolutionary extension of the eye” (Worthy, 1999, p71).

The inhibitory action of RF-EMF exposure on neurite outgrowth was also observed in a murine SN56 cholinergic cell line and rat primary cortical neurons 34. The effects of EMF exposure on neurite outgrowth were also studied in other frequency band EMFs, and the results suggested that neurite outgrowth is sensitive to EMF exposure 35,36. These results indicate that neurite outgrowth may be a major target by which RF-EMF affects eNSC development and suggest a potential mechanism by which RF-EMF ...
