A random vector (that is, a partially indeterminate process that produces vectors of real numbers) is said to be a white noise vector or white random vector if its components each have a probability distribution with zero mean and finite variance, and are statistically independent: that is, their joint probability distribution must be the

Quantization of a probability distribution.
Understand Noise Sources: The three dominant sources of A/D noise are quantization, ac (phase noise, or jitter in sampling of ac signals), and wideband (white noise, digital feedthrough, etc.). The last one is the most amenable to dc histogram testing.
